were first described by Irish mathematician William Rowan Hamilton in 1843 and applied to mechanics in three-dimensional space. Hamilton defined a quaternion as the quotient of two directed lines in a three-dimensional space, or equivalently, as the quotient of two vectors.

In mathematics, the Euclidean algorithm, or Euclid's algorithm, is an efficient method for computing the greatest common divisor (GCD) of two integers (numbers), the largest number that divides them both without a remainder. It is named after the ancient Greek mathematician Euclid, who first described it

linear time logic; the one most computer scientists seemed to find natural I called branching time. (These terms were used by temporal logicians, but they distinguished the two logics by the axioms they satisfied, while I described them in terms of different kinds of semantics.) In the linear range, the uniaxial stress-strain relation is given by Hooke's law as $s = E \epsilon$ (2-3) where the constant of proportionality E , the slope of the linear part of the stress-strain curve, is called Young's modulus or the modulus of elasticity. E is a measure of the
